Table of Contents

General Methods 2

Characterization Data 2

1H and 13C NMR Spectra 10
General Methods

\(^{1}\text{H}-\text{NMR}\) and \(^{13}\text{C}-\text{NMR}\) spectra were recorded on a 400 MHz spectrometer from Bruker using CDCl\(_3\) as the deuterated solvent. The chemical shifts (\(\delta\)) are reported in parts per million (ppm) relative to internal TMS (0 ppm for \(^{1}\text{H}-\text{NMR}\)) or the residual CDCl\(_3\) peak (77.0 ppm for \(^{13}\text{C}-\text{NMR}\)). The coupling constants (\(J\)) were reported in Hertz (Hz). IR spectra were recorded on an FT-IR spectrometer. Mass spectra were recorded using electron ionization (EI) or electrospray ionization (ESI). All chemicals were used as received unless otherwise stated. Tetrahydrofuran (THF) was purified by passing over a column of dry alumina or freshly distilled from sodium with benzophenone as an indicator. Dichloromethane (DCM) and diisopropylamine (DIA) were distilled from calcium hydride (CaH\(_2\)). Other solvents were used without any purification. Glassware, NMR tubes, stir bars, and needles were dried overnight in an oven heated at 130°C. All reactions were performed under nitrogen atmosphere unless otherwise noted. Neutral organic compounds were purified by flash column chromatography using silica gel F-254 (230-499 mesh particle size) as the stationary phase and using ethyl acetate (EtOAc) and hexanes as the mobile phase. Yields refer to isolated material judged to be \(\geq 95\%\) pure by \(^{1}\text{H}\) NMR spectroscopy. Enantiomeric excess values were determined using chiral OD column packed with Cellulose tris (3,5-dimethylphenylcarbamate) coated on 10\(\mu\)m silica gel, UV-detector detecting at 254nm, and mobile phase composed of HPLC grade n-hexane and 2-propanol.

Characterization Data
