GENERAL METHODS

Reactions were carried out in sealed vials or round bottoms flasks under atmospheric conditions unless otherwise noted. Diethyl ether (Et₂O) was dried over pressed Na. All other commercially available anhydrous solvents and reagents were used as received. Thin layer chromatography was performed with glass or aluminum plates (silica gel F₂₅₄, Art 5715, 0.25 mm), visualized by fluorescence quenching under UV light, and stained with potassium permanganate. Flash column chromatography was performed with silica gel 60 (200-400 mesh) as described by Still.¹ Mass spectral data was acquired using positive mode Electrospray Ionization (ESI+) and a high resolution Time of Flight (TOF) mass spectrometer. Infrared spectra were acquired on a FTIR spectrometer and were reported as wavenumbers (cm⁻¹). ¹H NMR spectra were acquired at 400 or 500 MHz and ¹³C NMR spectra were acquired at 100 MHz or 125 MHz where noted. ¹H and ¹³C NMR chemical shifts are reported as in ppm, (δ) relative to the residual solvent peaks. ¹H NMR coupling constants (J) are reported in Hertz (Hz), and multiplicities are indicated as follows: s (singlet), br. s (broad singlet), d (doublet), t (triplet), q (quartet), quint (quintet), sept (septet), dd (doublet of doublets), ddd (doublet of doublet of doublets), dt (doublet of triplets), td (triplet of doublets), ddt (doublet of doublet of triplets), dq (doublet of quartets), qq (quartet of quartets), m (multiplet), app. (apparent). Based on intensity in the ¹³C spectra, both magnetic and chemical shift equivalent peaks are noted in parentheses.

General Procedure for Acid-Mediated Exchange Studies (Table 2): To a 1 dram vial was added the appropriate pyranone (0.1 mmol, 1.0 equiv.) as a stock solution in 1:1 CH\(_3\)CN:H\(_2\)O or 1:1 CH\(_3\)CN:CH\(_3\)OH as appropriate (0.1 M). Next, acid was added (0.1 mmol, 1.0 equiv.). The vial capped and stirred at room temperature. At various time points throughout the reaction 200 \(\mu\)L aliquots were removed, concentrated via rotary evaporation, and re-dissolved in 0.7 mL of a stock solution of 1,3,5-trimethoxybenzene in CDCl\(_3\) (0.00286 M, 0.002 mmol per aliquot) as an internal standard. GENERAL PROCEDURE FOR MICROWAVE-ASSISTED REACTIONS (TABLE 3)

To a 10 mL microwave reactor vial was added the appropriate pyranone (0.1 mmol, 1.0 equiv.) as a stock solution in 1:1 CH₃CN:CH₃OH (0.1 M). To the vessel was added a stir bar and a silicone/PFTE vial cap. The resulting solution was heated via microwave with stirring at various temperatures. A ramp time of 2 minutes was used to achieve the appropriate temperatures, and after reaching the desired temperature, solutions were stirred for 10 minutes. Upon completion of heating 200 μL aliquots were removed, concentrated via rotary evaporation, and re-dissolved in 0.7 mL of a stock solution of 1,3,5-trimethoxybenzene in CDCl₃ (0.00286 M, 0.002 mmol per aliquot) as an internal standard. This solution was transferred to an NMR tube for analysis and determination of yield.

GENERAL PROCEDURE FOR MICROWAVE-ASSISTED REACTIONS (TABLE 4)

To a 10 mL microwave vessel was added acetoxypyranone anti-1b (1.0 equiv.) and alcohol (2.0 equiv.) dissolved in acetonitrile (1 M). To the vessel was added a stir bar and a silicone/PFTE vial cap. The resulting solution was heated via microwave for 1 h at 160 °C with an 8 min ramp time. The solution was then concentrated, and purified by flash column chromatography. Yields represent the combination of diastereomers, while spectral information represents the specific diastereomer shown.

COMPUTATIONAL METHODS AND EXPERIMENTAL PARAMETERS

Conformation search of oxocarbenium 7 was performed. Initial structures were generated utilizing a systematic conformation searching approach, and minimized with the MMFF94 force field using the Spartan ‘02 software package (Wavefunction, Inc.). Multiple representative low energy conformers generated from the search were transferred to the Gaussian ‘03 software package (Gaussian, Inc.), and geometries were optimized using Density Functional Theory (DFT) at the B3LYP level of theory, and a 6-31G** basis set with d(6) Cartesian diffuse functions. Analysis of the optimized low energy conformer of 7 shows the $\alpha$-hydrogen of oxocarbenium 7 at a dihedral angle of 48.8° with respect to the carbonyl.
